

Increased Grape Yields with Less Potassium

Katalyst® 0-0-25 is an innovative potassium product for progressive farmers interested in more efficient crop nutrition and higher yields. It is soluble, chloride free, and compatible with other products. Katalyst is effective and safe for both soil and foliar use, making it a uniquely versatile and effective potassium product.

A trial was conducted in Monterey, CA on grapes of the Pinot Noir variety, to compare yield differences with the use of different potassium treatments. The plots were single rows (2610 ft² per plot) with 4 replicates. Treatments were applied 3 times per season. The grower cared for the whole field and hand harvested the grapes and the research team weighed the gondolas.

Katalyst was over 3X more efficient in grape production with no significant reduction in °Brix

*There was no significant treatment effect on Brix (p=0.05)

Proven Results with Katalyst

- Katalyst not only increased yields, it outperformed KTS with less potassium applied.
- Both Katalyst treatments statistically out-yielded the control, the KTS did not.
